

Information from the user inputs:

In the first field the user writes a letter, each letter is checked continuously until the user input equals "ko". If input is correct, a successful message is displayed in the console. If not, another message is displayed in the console.

In the second input field, text is input. Through pressing the "validate pig" button, a similar function to the first one is executed with the appropriate message in the console.

In the third input field again text is written from the user. When the button "validate" is pressed, all three input fields are validated and the appropriate communication messages are displayed in the console.
